Breaking the Chain of Infection in Early Care and Education

Germs need a victim, like a person who is not immune to the germ.

Germs need a place to grow and multiply — a place that provides food and moisture.

After they grow, germs hitch a ride from the place where they grow, looking for a new victim.

A kitchen counter, a wound, or your lungs are some places where germs can grow.

Infectious diseases are caused by germs. Bacteria and viruses are the germs that cause most illness in early care and education. Germs are also called microbes.

You can help break the chain of infection!

• When you get enough sleep and exercise, and eat healthy food your immune system is better at fighting infections.
• When you get vaccinations against infectious disease you are less likely to get sick with those diseases. If you don’t get sick, you won’t expose others who are vulnerable, especially infants, elderly people, and people with chronic illnesses who don’t have well-functioning immune systems.

Germs get into our bodies when we touch an object or surface where germs are living and then we touch our nose, eyes, or mouth, or we touch an open sore on our body, or we breathe germs in the air into our lungs.

Some ways that germs travel:
• A toddler with a cold mouths a toy.
• Germs fly out of your nose and mouth when you sneeze and cough, or even talk or sing.
• You go to the bathroom and flush the toilet leaving germs on the toilet lever.

Some ways that germs spread:
• On contaminated sponges and mops
• In food shared when someone did not wash their hands or cover their sneeze
• In the blood of someone who has a blood borne infection
• In the air

We can break the chain of infection when we keep germs from traveling.
Some ways we stop germs:
• Sneezes in our sleeve.
• Cover our wounds.
• Wash our hands so germs go down the drain instead of on the door knob or on the food we eat for lunch.
• If recommended by the CDC, wear a mask. Even children as young as 2 can wear a mask. When everyone wears a mask, the risk of transmitting a respiratory disease goes way down.

Germs need a susceptible victim. When you are tired or rundown, your immune system doesn’t work very well. If you haven’t been vaccinated, you can get dangerous infectious diseases like measles, hepatitis, and whooping cough.

Infectious diseases are caused by germs. Bacteria and viruses are the germs that cause most illness in early care and education. Germs are also called microbes.

We can break the chain of infection by:
• cleaning, and by sanitizing and disinfecting when and where necessary,
• opening windows or using properly working ventilation equipment to bring in fresh air, filter germs, and dilute the germs in the air.

Some ways that germs spread:
• On contaminated sponges and mops
• In food shared when someone did not wash their hands or cover their sneeze
• In the blood of someone who has a blood borne infection
• In the air
